Product Description

White Silver 1000*2000mm SS 304 Sheet Standard Surface 4mm Stainless Steel Plate

Properties of Stainless Steel 304 Sheets

The most important characteristics of 304 stainless steel is its known as an austenitic material, that means it is a non-magnetic, metallic, iron allotrope with an alloying element.

It has a eutectoid point which occurs at 727 degree C. The austenite allotrope occurs at room temperature in stainless steel.

Because of its low carbon content, it is generally safe for use in most welding operations common in construction, as the formation of carbide precipitation occurs during welding is minimized.

304 grade shows outstanding rust resistance and low intergranular corrosion. The 304 grade does not need annealing after the welding has been performed.
